Stamp 1G – Full Irish Work Authorization | Available Immediately | Open to Hybrid Dublin Roles

Professional Summary

Automation test engineer with 32 months of QA experience and four automation projects built from scratch. I build and maintain automated regression suites for web portals and REST APIs using Playwright (TypeScript), Selenium WebDriver (Java, TestNG), and Python (pytest), all running in CI/CD with GitHub Actions and Jenkins. At Optum I also did hands-on manual API testing with Postman and Swagger, sending requests, checking responses and status codes, and validating against the API contract, alongside feature testing, release management, and user acceptance testing. Comfortable with SQL and MongoDB for data validation, k6 and JMeter for performance testing, and clear test and quality reporting, supported by an MSc in Data Science and Analytics. Based in Ireland, open to hybrid work in Dublin, and available immediately.

Work Experience

July 2021 – February 2024 **Associate Software Engineer / SDET - UnitedHealth Group (Optum)**

Hyderabad, India · QA Engineer for SmartDCOM, an enterprise platform managing infrastructure decommissioning workflows across servers, databases, storage, middleware and network assets

- Owned feature testing in an Agile team by reviewing requirements, designing test cases, maintaining user story-to-test traceability, executing Jenkins-based regression checks, validating across test, staging and production, and supporting release sign-off. Covered 300+ user stories over 32 months.
- Tested the most sensitive workflows, including deletion-trigger APIs, rollback and recovery and scheduled auto-deletion jobs, to confirm that each deletion was authorised, correctly scoped and fully logged, with heavy negative, edge-case and exploratory testing to prevent accidental data loss incidents.
- Performed functional and regression testing of the platform's REST APIs, checking request and response behaviour, status codes and error handling, with the regression suite executed through the Jenkins pipeline in test, stage before each production deployment.
- Ran bi-weekly production calls, raised change tickets in ServiceNow, sent maintenance emails to stakeholders, validated pull requests through GitHub & Jenkins, executed sanity and regression tests within the maintenance window, reported release and test status, and supported rollback or re-testing when issues were found.
- Managed defects end to end in Jira: identified root causes, wrote clear defect reports, coordinated with developers to close them, and re-tested across environments. Supported production triage using logs and transaction records to catch data and integration issues early.
- Participated in Agile ceremonies including sprint planning, daily stand-ups, retrospectives, release planning and defect triage, contributing QA input throughout the delivery lifecycle.
- Collaborated with product owners during one-to-one discussions and sprint grooming sessions to clarify acceptance criteria, refine test scenarios, and ensure features were test-ready before sprint execution.
- Reported sprint-level QA metrics including test execution status, defect status, regression coverage, release readiness, and unresolved quality risks to support go/no-go decisions.
- Developed 2 major user-facing features using Angular, Spring Boot, MySQL and 30+ minor features requests, giving strong application-level support that improved test design, defect analysis, and regression validation.

Tools: Jira, Jenkins, GitHub, ServiceNow, REST API testing, SQL Server, MySQL, Oracle, Agile / Scrum

Technical Skills

QA and test design: test case design and execution from user stories, manual and automated testing within sprints, system and regression testing, defect analysis, peer review of test work

Test automation: Playwright (TypeScript, Page Object Model), Selenium WebDriver 4 (Java, TestNG, Page Object Model), Python (pytest, requests); automated regression suites for web portals and REST APIs; cross-browser UI automation; quick to adopt Cypress

API and databases: manual API testing with Postman and Swagger, REST API testing, JSON Schema validation, status-code and contract checks; relational databases (MySQL, SQL Server) and NoSQL (MongoDB)

CI/CD and tools: GitHub Actions, Jenkins, Docker, Git, automated quality gates; k6 and JMeter performance testing

Test management and metrics: Jira, requirement-to-test traceability, test coverage, defect metrics, quality reporting, sprint-level test status

Languages and process: Java, JavaScript, TypeScript, Python, SQL, Node.js; Agile / Scrum, sprint planning, daily stand-ups, retrospectives, continuous improvement

Personal Test Automation Projects

Playwright UI and API Test Framework (TypeScript)

github.com/SaiTejaReddyYeldandi/playwright-typescript-ui-api-framework

- Built a Playwright and TypeScript framework that tests the same web application two ways: an API suite and a cross-browser UI suite, both run in CI against the same Dockerised Node.js app.
- API side: covers login, full CRUD, response and status-code contract checks, and negative and error cases (401 / 404 / 422), using Playwright's API request context.
- UI side: Page Object Model with custom fixtures for authentication reuse and per-test state reset, run across Chromium, Firefox and WebKit.
- Gated in GitHub Actions with a fast API and Chromium smoke check on every pull request and a full cross-browser regression job; HTML reports and traces on failure, plus a requirement-to-test traceability matrix.

Tools: Playwright, TypeScript, Node.js, Page Object Model, GitHub Actions, Docker, Express

Hybrid UI and API Automation Framework (Java + Python)

github.com/SaiTejaReddyYeldandi/hybrid-automation-framework

- Built one framework that tests the same web application two ways: a Python suite for the REST API and a Java/Selenium suite for the browser UI, both run in CI against the same Dockerised app.
- API side: 29 pytest tests covering login, full CRUD, JSON Schema contract checks, and negative/error cases including 401, 404, and 422.
- UI side: Selenium 4 and TestNG suite using Page Object Model, with 5 tests run in parallel across Chrome and Firefox on a Dockerised Selenium Grid.
- Ran a fast smoke check on every pull request and a full cross-browser regression nightly in GitHub Actions, with a 44-case traceability matrix linking requirements to tests.

Tools: Java, Selenium 4, TestNG, Python, pytest, REST API testing, JSON Schema, Docker, GitHub Actions

Performance and Load Testing Suite with a CI Quality Gate

github.com/SaiTejaReddyYeldandi/performance-test-suite-k6-slo-gated-ci

- Built a performance-testing suite that load-tests a REST API backed by a database and automatically fails any pull request that makes the service slower.
- Ran five load profiles (baseline, load, stress, spike, soak) with k6 and JMeter against a service seeded with 20,000 records, then analysed results in Python (pandas, NumPy) to work out p50 / p95 / p99 latency and error rate.
- Set performance limits per endpoint and failed any build on a breach or a slowdown over 10% against a saved baseline. A real run handled 14,799 requests at 22.6 ms p95 with 0% errors, and the gate once caught a route-ordering bug that returned errors on every search request.

Tools: Python, k6, JMeter, FastAPI, MongoDB, pandas, NumPy, Docker, GitHub Actions

MongoDB Query Engine Correctness and Regression Test Suite

github.com/SaiTejaReddyYeldandi/mongodb-query-engine-correctness-regression-test-suite

- Built a 93-test Python suite (pytest) that checks whether MongoDB aggregation queries return the correct answer, using a Python reference engine to compare results and property-based tests with Hypothesis.
- Ran the whole suite automatically in GitHub Actions against MongoDB 6.0, 7.0 and 8.0 using temporary Docker containers, catching three real correctness differences between versions.

Tools: Python, pytest, pymongo, Hypothesis, Docker, testcontainers, MongoDB 6/7/8, GitHub Actions, Allure

Education

Sept 2024 - Jan 2026 (Completed) **MSc Data Science and Analytics - Munster Technological University, Cork**
Databases, Scientific Programming in Python, Data Management Systems, Distributed Data Management, Applied Statistics, Regression Analysis, Data Visualisation, Time Series Analysis, Machine Learning, Data Science Analytics Project

2017 – 2021 **B. Tech Computer Science Engineering - JNTU, Hyderabad, India**

Certifications and Achievements

- Certified Full Stack Engineer (Java) - Optum Global Solutions India.
- HackerRank: Angular and JavaScript (Intermediate); Gold badges in Java, Python and C.
- Certificate of Excellence (VP Anne Finch, Optum); Bravo Award (Director Dave Bissegger, Optum).
